Retention and use of this Thesis by the University

I, **Robert Cossart** candidate for the degree of **Masters of Science (Research)** accept the requirements of the University relating to the retention and use of theses deposited in the Library. I agree that the original of my thesis deposited in the Library should be accessible for purposes of study and research, in accordance with the normal conditions established by the Librarian for the care, loan or reproduction of theses.

I agree to abide by any general conditions established by the University for the care, loan or reproduction of theses and any special conditions of usage in relation to this thesis entitled:

Sedimentation of a terminal floodplain: The Narran system

The University of Canberra participates in the Australian Digital Thesis (ADT) database program and encourages candidates to make their thesis available in this way. The ADT program website is <http://adt.caul.edu.au>. UC policy in regard to the ADT is set out in Higher degrees by research: policy and procedures (the Gold Book) (7.3.6). Further advice may be obtained from the UC Library by email to e-theses@canberra.edu.au.

I further authorise the Library to mount my thesis onto the Australian Digital Theses (ADT) Program database. I provide a final copy of the thesis in electronic form for this purpose. I authorise the Library to scan a paper copy of the thesis should an electronic copy of the thesis not be available. I am aware that others may access my thesis for study and research purposes, subject to the law of copyright.

In terms of the conditions for the submission of an electronic copy of the thesis, I confirm:

- That the complete thesis (including all appendices and attachments) is contained in the electronic version of the thesis that I submit; and
- That there are no sections of the thesis to which copyright is held by another source

Signature of Candidate

Date

This thesis acknowledges the traditional custodians of this land who have cared for and nurtured the landscape for tens of thousands of years

Acknowledgements

First and foremost, I would like to thank my supervisors Professor Martin Thoms and Dr Michael Reid. Your knowledge, patience and guidance over the past few years has been invaluable. Thankyou for your array of ideas, the endless editorial comments on the many drafts of this thesis, for continually reminding me of the importance of structure in my writing and for the belief that this project would one day reach completion.

This project was funded by a grant to Professor Martin Thoms, and undertaken as part of the Narran Ecosystem Project. I am extremely grateful to the Murray Darling Basin Commission and the eWater Cooperative Research Centre (CRC) for a postgraduate scholarship. In addition, I wish to thank the eWater CRC for the financial assistance that allowed me to present the results of this work at several international conferences and the River Basin Management Society who provided a postgraduate student grant to undertake geochemical analysis.

To all members of the Narran research team, thankyou for your help, patience and encouragement, in particular Dr Sam Capon, Dr Mark Padgham, Dr Scott Rayburg and Nolani McColl. Dr Melissa Parsons, thankyou for your constant support, clarification of concepts and for the constructive chats on ‘what is my thesis.....?’. Anna Collins your tireless support during the months of laboratory analysis and sifting of sediments is greatly appreciated. Dr Heather McGinness thankyou for helping me navigate my way through the turbulent water known as a thesis. I also wish to thank Dr Tim Pietsch from CSIRO for sediment dating, Associate Professor Brian Jones at the University of Wollongong for assistance with grainsize analysis and Jeremy Manders from QLD NRM for extracting sediment cores. Thankyou to the Department of Water for allowing me time to complete the write up of this thesis.

To my room-mates in 3B16, past and present, thank you. Thank you for your patience with my array of questions, and for putting up with my constant foghorn voice. Maxi ‘I see you too Gerry Gerry’ Southwell, Vic ‘the General’ Hughes, Craig ‘The Hoff’ Boys and Unique ‘Mooners’ Webb thanks for the laughs, assistance and friendship over the past 3 years. To Renae Palmer, thank you for all your help with the graphics and the formatting of the thesis.

To everyone who has provided feedback on manuscripts and presentations, my sincerest thanks; your comments have greatly improved this thesis. A big thankyou to Tony Buckmaster for your constant support, friendship and most importantly library access over the past 6 years and finally to Ben Corey for doing absolutely nothing at all.

To the Fitzclarence family (Cass, Dixie, Rob and Virginia) thank you for your friendship and support over the past few years. You continually reminded me there was more to life than Uni and this thesis, and allowed me to explore your beautiful part of the world, 'Wongerabelle'.

I would like to thank my parents, David and Deborah for their love, support and patience over the past 7 years of university and financial aid when the scholarship ran out. Without your encouragement and belief, I doubt this thesis would have reached completion. To my brother Cameron, thank you for always being available on the other end of the phone at any hour of the day or night. To my partner Fee, thank you for your support, love and patience. You have always been there to listen to the excitement about my, at times, erratic thesis progression. Thank you to team Cossingle, your support and editing over the past few months has been the saviour of this thesis. Finally yet importantly the 'boyz'- Tacker, Beamer and Hamish - thank you for keeping me sane and reminding me that no matter how stressed, tired or bitter I became nothing was more important than a walk.

The completion of this thesis has been as much a journey of self-discovery as it has been a journey of scientific inquiry.

Abstract

Environmental change is placing increasing pressure on the sustainability of many ecosystems. Floodplains are an ideal system for the investigation of long-term change within riverine landscapes, as they are sensitive to both natural and anthropogenic processes. Sediments contained within floodplain deposits represent an archive of historical change. Our knowledge of sedimentation within terminal dryland floodplains is limited and this impedes our ability to understand and manage them in the face of changing environmental conditions. The research presented in this thesis addresses an important knowledge gap in the area of terminal floodplain systems and it seeks to investigate the environmental history of a significant Australian terminal floodplain, the Narran system. The Narran system is a Ramsar wetland of international importance, located within the Lower Balonne Floodplain which straddles the NSW/QLD border. The Condamine Balonne catchment is a region of increasing land and water development which poses a threat to the functioning of this floodplain. .

This thesis employs a hierarchical study design to investigate the morphostratigraphic response of a terminal floodplain system to environmental change at a number of different scales. The results of this thesis demonstrate that the Narran system does not support the current conceptual models of sedimentation within terminal dryland floodplains. These models suggest terminal floodplains form as a result of mobile aggrading splays. This study demonstrates the Narran system to be a stable geomorphic feature that has formed as a series of terminal lakes and floodplains. A series of structural lineaments have confined the lakes to a small regional trough for at least 440 ka, while low sediment yields (3.9 to $13.9 \text{ kg km}^2 \text{ yr}^{-1}$) have assisted in maintaining the stability of this system.

The Narran system is demonstrated to have a complex morphostratigraphic response to changing environmental conditions. The lakes have undergone a morphological divergence from one large basin approximately 440 ka ago, to two smaller basins about 330 ka ago, and more recently formed into three lakes around 78 ka ago. Overall the stratigraphy of the lakes and adjacent floodplain has displayed a reduction in fluvial energies, with sediment deposition changing from a system dominated by bed-load transport to one dominated by pelagic deposition. However, there have been three distinct periods of sediment accumulation. Up to 440 ka ago, sediments accumulating in the Narran system were indicative of a high energy

fluvial bed-load system that supplied well sorted sands derived from the upstream Condamine and Maranoa sub-catchments. This was followed by a period of fluctuating energy and sediment supply conditions and a fluctuating transition from a high-energy bed-load environment to a low-energy pelagic environment. The provenance of sediment that accumulated in the Narran system between 440 and 78 ka ago was highly variable, fluctuating between the Condamine and Maranoa sub-catchments. For the last 78 ka, the lakes have received sediment derived from the Maranoa sub-catchment whilst the floodplain has received sediment from both sub-catchments. It is suggested that the changing climatic and catchment influences on the Narran system are associated with glacial and inter-glacial oscillations and the growing aridity of eastern Australia.

A multi-proxy approach within a hierarchical framework was applied in this thesis to establish multiple lines of evidence of floodplain sedimentation. This approach has allowed patterns of sedimentation and processes influencing these to emerge at different levels of organisation. Each line of evidence established for the Narran system displayed a different pattern demonstrating that different patterns occur at different places in space and time. This has not previously been identified within terminal floodplains. The approach taken in this thesis is not a traditional method for investigating floodplain sedimentation. However, it highlights the utility of combining standard sedimentological techniques and multivariate statistics within a hierarchical framework to convey a high resolution of floodplain sedimentation. This thesis contributes to the science of floodplain sedimentation by providing a different perspective on the accumulation of sediments within a terminal dryland floodplain.

Chapter 2: Literature Review

- Figure 2.1.** Model of lateral and vertical accretion deposits for meandering rivers. This typical model of vertical floodplain accretion from overbank flows shows no upward fining or coarsening trends (top) and a typical upward fining sequences of lateral accretion resulting from channel migration (bottom) (Modified from Allen 1970). 10
- Figure 2.2.** Block Diagram indicating morphological elements of a river floodplain system. Erosion is on the outside of bends and the lateral accretion is on the inside of bends (point bar). Vertical accretion overlays lateral accretion. This figure also highlights the array of geomorphic features within a floodplain system such as oxbow lakes and crevasse splays (Modified from Walker and Cant 1984)..... 11
- Figure 2.3.** Tectonic and climatic setting for the formation of a terminal floodplain system within a dryland region (adapted from Nichols and Fisher, 2007). 15
- Figure 2.4.** Morphostratigraphic model of a terminal floodplain system in a dryland region. Proximal, medial and distal sedimentary processes both in channel and over bank across a terminal floodplain (Nichols and Fisher 2007). 16
- Figure 2.5.** Hierarchical organisation of riverine landscapes with dominant processes influencing the geomorphic complexity at each level of organisation..... 21

Chapter 3: Study Area, Design and Methods

- Figure 3.1.** The Lower Balonne floodplain and six anastomosing channels located between St George (QLD) and Walgett (NSW). 26
- Figure 3.2.** The Narran system with the geomorphic regions of Narran Lake, Clear Lake, Back Lake, Long Arm, Floodplain (southern and northern) and Delta. This study investigates sedimentation within the northern section (Clear Lake, Back Lake, Long Arm and Northern Floodplain). 33
- Figure 3.3.** Average monthly discharge for the Narran River at Wilby Wilby (1965-2004). 35
- Figure 3.4.** Average daily discharge for the Narran River at Wilby Wilby from 1965-2004. 36
- Figure 3.5.** Hierarchical study design used in this thesis outlining the three spatial scales (geomorphic regions, within geomorphic regions and depositional units) used to investigate sedimentation within the Narran system. A variable number of samples were taken from each depositional unit with 27 sediment variables measured from each sample. 38
-

Figure 3.6. Location of sediment cores (n=12) extracted from the Narran system. The dots indicate the location of the sediment cores. Three cores were extracted from each of the geomorphic regions of Clear Lake, Back Lake, Long Arm and Floodplain. 39

Figure 3.7. Extraction of sediment cores using a piston driven coring rig. Sediment cores were extracted in 1.4-metre lengths encased in steel housings using an undersized cutting tool. Cores were sealed in black polyethylene tubing, before the removal of steel housing, to avoid light contamination and transported back to the laboratory for sampling (Photos by M. Southwell). 41

Chapter 4: Sedimentation within Narran

Figure 4.1. The stratigraphy of the Narran system. (a) Stratigraphy of the Narran cores; and, (b) common depositional units (Cross sectional photos of sediment cores are in appendix 2). Sediment dates are plotted to establish a chronology. The age of the surface and backwater units of the cores is joined to highlight differences in age. 53

Figure 4.2. The textural composition of sediments extracted from the Narran system classified by geomorphic regions. Particle size fractions based on the British Standards (outlined in Brady, 1990), and plotted using a Ternary plot based on that presented in Pickard (1971). 60

Figure 4.3. The textural composition of sediments extracted from the Narran system classified on depositional units. Particle size fractions based on the British Standards (outlined in Brady, 1990), and plotted using a Ternary plot based on that presented in Pickard (1971). 61

Figure 4.4. Physical character of the sediment cores Clear Lake, Back Lake, Long Arm and the Floodplain– Sediment texture (%sand, % silt and % clay), median grain size (D_{50}). 65

Figure 4.5. Core profiles of sediment geochemistry at the within geomorphic region level of organisation. Each geochemical element displayed a profile towards the surface of either constant, increase, decrease or compound with the profiles demonstrating either gradual, abrupt, fluctuating or spiked changes a) Profiles: constant, increase, decrease and compound; b) pattern of change: gradual, abrupt, fluctuating and spikes; and c) Geochemical profiles for each sediment core (Geochemical stratigraphies are presented in appendix 3) 73

Figure 4.6. Bivariate plots of textural data in the Narran system. Plots are described using the envelopes of (a) Stewart (1958) to differentiate river, wave and quite water depositional environments; (b) Sly (1977 & 1978) to interpret differences between low energy and high-

energy environments; and (c) Passega (1957 & 1964) as an indicator of depositional environments (C/M diagrams)..... 77

Chapter 5: Catchment influences on Narran

Figure 5.1. Hierarchical study design used to investigate sedimentation in the Narran system at a range of spatial and temporal scales. 94

Figure 5.2. Down core plots of Ti/Al ratios for sediment extracted from the middle of core 'b' of Clear Lake, Back Lake and Long Arm of the Narran system indicating the variability of sediment provenance. Each core has the corresponding lithofacies (left) and depositional unit (right) diagrams plotted. Dotted line in the centre indicates the mean of the Condamine and Maranoa Ti/Al ratios (0.0709). Sediment dates are plotted to establish a chronology. 101

Figure 5.3. Down core plots of Ti/Al ratios for sediment extracted from cores along the Floodplain of the Narran system indicating the variability in sediment provenance. Each core has the corresponding lithofacies (left) and depositional unit (right) diagrams plotted. Dotted line in the centre indicates the mean of the Condamine and Maranoa Ti/Al ratios (0.0709). Sediment dates are plotted to establish a chronology..... 102

Figure 5.4. Two-dimensional MDS ordination and PCC of sediment data from the Narran system at different levels or organisation: a) Geomorphic Regions; b) Cores (within geomorphic regions); c) Depositional Units; and d) Principal Axis Correlation (PCC)..... 104

Figure 5.5. Sediment composition groups for the three spatial scales of geomorphic regions, within geomorphic regions and depositional units. The dotted lines indicate units with similarity in sediment character whereas separation of groups indicates no similarity. (a) Geomorphic regions; (b) Cores (within geomorphic regions); and (c) Depositional units.... 105

Figure 5.6. SIMPER analysis highlighting the sediment variables contributing to the 90% similarity with each level of organisation. The percentage contribution gives the average contribution that sediment characteristics make to the total similarity (a) Geomorphic Regions; (b) Within geomorphic regions; and (c) Depositional Units..... 106

Figure 5.7. Two-dimensional MDS ordination of the three major depositional units (Surface, Cyclic and Sand) nested within geomorphic regions and corresponding PCC analysis: Surface (a & b); Cyclic (c & d); and Sand (e & f)..... 112

Figure 5.8. Results of SIMPER analysis highlighting the sediment characteristics contributing to the assemblage similarity within depositional units. The percentage contribution gives the average contribution that each sediment characteristic makes to the total similarity within each depositional unit. 113

Figure 5.9. Sediment composition groups for the three major depositional units (Surface, Cyclic and Sand) and geomorphic regions. The dotted lines indicate units with similarity in sediment character whereas separation of groups indicates no similarity (a) Surface; (b) Cyclic; and (c) Sand. 114
